1. Subject Code: AID-501 Course Title: Essential Mathematics for AI

2. Contact Hours: L: 3 **T:** 1 **P:** 0

3. Examination Duration (Hrs.): Theory: 3 Practical: 0

4. Relative Weightage: CWS: 20-35 PRS: 0 MTE: 20-30 ETE: 40-50 PRE: 0

5. Credits: 4 6. Semester: Autumn 7. Subject Area: PCC

8. Pre-requisite: Nil

9. Objective: To introduce students to the various Mathematical concepts to be used in ML and AI

S.No.	Contents	
		hours
1.	Basics of Linear Algebra: System of Linear Equations; Vector space and sub-	
	spaces (definition, examples and concepts of basis); Linear mappings; Matrices;	
	Eigenvalues and Eigenvectors Norms; Inner Product; Orthogonally; Spectral	
	Decomposition; Singular value Decomposition; Low-rank Approximation;	
	Projection; Principal Component Analysis and Generative Models	
2.	Gradient Calculus: Differentiation of univariate functions; partial derivatives and	6
	gradients; gradients of vector valued functions and matrices; Backpropagation and	
	automatic differentiation; Linearization and Multivariate Taylor Series	
3.	Optimization: Notion of maxima and minima; Optimization using gradient	8
	descent; Constrained Optimization techniques; Convex optimization Algorithms	
4.	Probability and Statistics: Basic concepts of probability: conditional probability,	14
	Bayes' theorem, random variables, moments, moment generating functions, some	
	useful distributions, Joint distribution, conditional distribution, transformations of	
	random variables, covariance, correlation, random sample, statistics, sampling	
	distributions, point estimation, MAP, MLE	
5.	Information Theory: Entropy, cross-entropy, KL divergence, mutual information;	4

4. Relative Weightage: CWS: 20-35 PRS: 0 MTE: 20-30 ETE: 40-50 PRE: 0

5. Credits: 4 6. Semester: Autumn 7. Subject Area: PCC

8. Pre-requisite: Nil

9. Objective: To learn the design of hardware architectures and accelerators for deep-learning/artificial-intelligence. This course is at the intersection of deep-learning and computer-architecture/embedded-system/VLSI.

S.No.	Contents	Contact Hours
1.	Background topics: Approximate computing and storage, Roofline Model, Cache tiling (blocking), GPU architecture, CUDA programming, understanding GPU memory hierarchy, FPGA architecture, Matrix multiplication using systolic array	8
2.	Convolutional strategies: Direct, FFT-based, Winograd-based and Matrix-multiplication based.	3
3.	Deep learning on various hardware platforms: Deep learning on FPGAs and case study of Microsoft's Brainwave, Deep learning on Embedded System (especially NVIDIA's Jetson Platform), Deep learning on Edge Devices (smartphones), Deep learning on an ASIC (especially Google's Tensor Processing Unit.), Deep-learning on CPUs and manycore processor (e.g., Xeon Phi), Memristor-based processing-in-memory accelerators for deep-learning.	15
4	Memory-efficiency and reliability of DNN accelerators: Model-size aware Pruning of DNNs, Hardware architecture-aware pruning of DNNs, Understanding soft-errors. Understanding reliability of deep learning algorithms and accelerators	6
5	Memory-related tradeoffs in DNN accelerators: Comparison of memory technologies (SRAM, DRAM, eDRAM, STT-RAM, PCM, Flash) and their suitability for designing memory-elements in DNN accelerator, Neural branch predictors and their applications	4
6	Autonomous driving and DNN training: Hardware/system-challenges in autonomous driving, Distributed training of DNNs and addressing memory challenges in DNN training	6
	Total	42

8. Pre-requisite: Nil

9. Objective: To provide an understanding of the theoretical concepts of machine learning and prepare students for research or industry application of machine learning techniques.

S.No.	Contents	Contact hours
1.	Introduction: Well-posed learning problems, examples of machine learning applications, model selection and generalization, concept learning, inductive learning hypothesis, inductive bias. Information theory: entropy, mutual information, KL divergence	4
2.	Performance Optimization: Directional Derivatives, Minima, Necessary Conditions for Optimality, Convex function, Gradient Descent, Stable learning rates, Newtons Method, Conjugate gradient method, The Levenberg-Marquardt algorithm.	4
3.	Linear Classification: Linear classifier, Logistic Regression, Decision Boundary, Cost Function Optimization, Multi-class Classification, Bias and Variance, L1 and L2 Regularization, feature reduction, Principal Component Analysis, Singular Value Decomposition	4
4.	Artificial Neural Networks: Perceptron, Linear Networks, Multi-layer Networks, Forward propagation, Backward propagation, Alternative activation functions, variations on backpropagation, Deep neural networks.	5
5.	Decision tree learning: Decision tree representation, appropriate problems for decision tree learning, hypothesis space search in decision tree learning, inductive bias in tree learning, avoiding overfitting the data, alternative measures for selecting attribute values, ensemble methods, bagging, boosting, random forest	5
6.	Support Vector Machines: Computational learning theory, probably approximately correct (PAC) learning, sample complexity and VC dimension, linear SVM, soft margin SVM, kernel functions, nonlinear SVM, Multiclass classification using SVM, Support vector regression.	5
7.	Instance based learning: K-nearest neighbor learning, distance weighted neighbor learning, locally weighted regression, adaptive nearest neighbor methods, The Concept of Unsupervised Learning, Competition networks, K-means clustering algorithm.	3

8.	Bayesian Learning: Bayes theorem, maximum likelihood and least squared error	
	hypotheses, Naive Bayes classifier, Bayesian belief networks, gradient ascent	7
	training of Bayesian networks, learning the structure of Bayesian networks, the EM	
	algorithm, mixture of models, Markov models, hidden Markov models.	
9.	Reinforcement learning: the learning task, Q learning, convergence, temporal	
	difference learning, nondeterministic rewards and actions, generalization,	5
	relationship to dynamic programming.

8. Pre-requisite: NIL

9. Objective: To introduce convex optimization algorithms to be used in various machine learning tools.

10. Details of the Course

S. No.	Contents	Contact
		hours
1.	Introduction: significance of optimization methods in machine learning, a brief	8
	review of the fundamentals of optimization, Convex sets and convex functions,	
	Problems in Convex Optimization (linear/quadratic/Semi-definite programming),	
	Strong and weak duality, rates of convergence	
2.	Optimization models : Types of optimization models arising in different areas of	6
	ML, large scale optimization	
3.	First order optimization methods: Gradient descent, stochastic gradient descent,	8
	NAG, Adam, ADMM, Frank and Wolfe, SVRG, AdaGrad, Implementation of	
	these algorithms and their advantages and disadvantages	
4.	Second and higher order optimization methods: Conjugate gradient, Newton's	8
	method, Quasi newton method, stochastic quasi Newton method, Hessian free	
	method, Natural Gradient Method, Implementation of these algorithms and their	
	advantages and disadvantages.	
5.	Optimization Solvers and Toolboxes: CVX (MATLAB), CVXPY (Python),	6
	CVXOPT (Python)	
6.	Case Studies: Recent developments and advanced optimization algorithms	6

4. Relative Weightage: CWS: 20-35 PRS: 0 MTE: 20-30 ETE: 40-50 PRE: 0

5. Credits: 4 6. Semester: Spring 7. Subject Area: PEC

8. Pre-requisite: CS-102

9. Objective: To educate students to the various concepts, algorithms and techniques in data mining and warehousing and their applications.

S.No.	Contents	Contact hours
1.	Introduction to data mining: Motivation and significance of data mining, data mining functionalities, interestingness measures, classification of data mining system, major issues in data mining.	3
2.	Data pre-processing: Need, data summarization, data cleaning, data integration and transformation, data reduction techniques —Singular Value Decomposition (SVD), Discrete Fourier Transform (DFT), Discrete Wavelet Transform (DWT), data discretization and concept hierarchy generalization.	6
3.	Data warehouse and OLAP technology: Data warehouse definition, multidimensional data model(s), data warehouse architecture, OLAP server types,data warehouse implementation, on-line analytical processing and mining,	4
4.	Data cube computation and data generalization: Efficient methods for data cube computation, discovery driven exploration of data cubes, complex aggregation, attribute oriented induction for data generalization.	4
5.	Mining frequent patterns, associations and correlations: Basic concepts, efficient and scalable frequent itemset mining algorithms, mining various kinds of association rules —multilevel and multidimensional, association rule mining versus correlation analysis, constraint based association mining.	6
6.	Classification and prediction: Definition, decision tree induction, Bayesian classification, rule based classification, classification by backpropagation and support vector machines, associative classification, lazy learners, prediction, accuracy and error measures.	6
7.	Cluster Analysis: Definition, Clustering Algorithms - partitioning, hierarchical, density based, grid based and model based; Clustering high dimensional data, constraint based cluster analysis, outlier analysis - density based and distance based.	6
8.	Data mining on complex data and applications: Algorithms for mining of spatial data, multimedia data, text data: data mining applications, social impacts of data mining, trends in data mining.	7

5. Credits: 4 6. Semester: Both 7. Subject Area: PEC

8. Pre-requisite: Nil

9. Objective: The objective of this course is to introduce the fundamental techniques and algorithms used for acquiring, processing and extracting useful information from digital images.

S.No.	Contents		
		Hours	
1.	Introduction: Signal processing overview; Image processing basics; Fundamental signals (1-D and 2-D); Classification of systems; Characteristics of LTI/LSI systems. Introduction to the DIP areas and applications.	4	
2.	Digital Image Fundamentals: Human visual system and visual perception; Image sensing and acquisition Image file types; Pixel representation and spatial relationship	4	
3.	Image Digitization: Sampling and quantization. Image Transforms: 2- D DSFT and 2-D DFT, 2-D discrete cosine transform (DCT), 1-D and 2-D Karhonen Loeve (KL) or principal component analysis (PCA) and 1-D and 2-D discrete wavelet transforms and relation to filter banks.	8	
4.	Image Enhancement: Point and algebraic operations, edge detection and sharpening, filtering in the spatial and transformed domains. Rotation, interpolation, image filtering, spatial operators, morphological operators.	6	
5.	Image Segmentation: Thresholding; Edge based segmentation; Region growing; Watershed transform. Image Restoration: Degradation models, inverse and pseudo-inverse filtering, 2-D Wiener filtering and implementation	6	
6.	Image Compression and Encoding: Entropy-based schemes, Transform-based encoding, Predictive encoding and DPCM, Vector quantization, Huffman coding.	4	
7.	Feature Extraction and Segmentation: Contour and shape dependent feature extraction, textural features, region-based and feature-based segmentation.	5	
8.	Pattern Classification: Standard linear and Bayesian classifiers, supervised Vs unsupervised classification, classification performance index. Applications in satellite, sonar, radar and medical areas.	5

11. List of Experiments:

1.	Read the DIACOM format from industrial / commercial MRI, CT and SPECT Machines.		
2.	Identify the body part from given image and categorize into anatomical system.		
3.	Identify the time series images to synchronize the random images according to human		
	anatomy.		
4.	Identify the anatomical and pathological abnormalities from a given image set.		
5.	Identify the physiological abnormalities from a given data set.		
6.	Manually segment MRI and CT Images of Heart, lungs and digestive system using Semi-		
	automatic soft tools.		
7.	Manually segment OCT Images of Eye using Semi-automatic soft tools.		
8.	Segmentation of medical images using CNN.		
9.	Identification of breathing pattern from ECG using CNN.		
10.	Categorization of sleeping pattern from EEG using CNN.		
11.	Deep Learning model and CT / OCT Image segmentation.

8. Pre-requisite: Knowledge of computer networks

9. Objective: To impart the know-how of Internet of Things and their applications, architectures and protocols, building IoT applications/systems, securing the IoT systems, and their recent advances.

S.No.	Contents	Contact
		hours
1.	Basic concepts revisited: Introduction to sensing & actuating, Basic networking,	7
	Wireless networks, Wireless sensor networks (WSN), Communication protocols,	
	and other enabling technologies, IoT standards, Data storage & management	
	issues and approaches, Cloud computing, Key challenges, research, and future	
	directions of IoT, and security & privacy issues.	
2.	Embedded Systems: Hardware and software of IoT, Microcontrollers,	6
	Understanding and programming Arduino, Raspberry Pi, NodeMCU, Lora, etc.	
	Integrating microcontrollers with sensors and actuators, Building the IoT	
	applications with any microcontroller.	
3.	IoT Architectures and Protocols: Layers of communication, Architectures:	9
	State-of-the-art, IoT architecture reference models, Different views of IoT	
	architectures and frameworks design, Protocols: Application protocols, Service	
	discovery protocols, Infrastructure protocols, and other protocols. Understanding	
	various types of protocols like HTTP, MQTT, CoAP, AMQP, 6LoWPAN, etc.	
	Cross-layer implementations, and Data dissemination.	
4.	Support Technologies for IoT: Big Data, Data Analytics, Artificial Intelligence,	8
	Mobile, Cloud, Software defined networks, 5G, and Fog/Edge computing. IoT	
	integration with recent technologies. State-of-the-art. Design goals, challenges,	
	and components.	
5.	Cyber Physical Systems: Industry 4.0, Society 5.0, Design & use cases,	6
	Development, and implementation insights some examples like smart cities, smart	
	homes, smart grids, smart agriculture, smart healthcare, smart transportation,	
	smart manufacturing, and other smart systems. State-of-the-art. Conceptualizing	
	the new IoT-based smart systems using a case study.	
6.	IoT Security & Privacy: –, IoT Security and Privacy issues and challenges, Risks	6
	involved with IoT infrastructures, Trust in IoT platforms and other integrating	
	technologies, Data aggregation, storage, retrieval, and other management issues	
	including fault tolerance, interoperability, security, and privacy, Cyber-physical-	
	systems and their security and privacy, Mitigation approaches.

NAME OF DEPARTMENT/CENTRE: Mehta Family School of Data Science and Artificial Intelligence

1. Subject Code: AID-567 Course Title: Introduction to Materials Informatics

2. Contact Hours: L: 3 T: 1 P: 0

3. Examination Duration (Hrs.): Theory: 3 Practical: 0

4. Relative Weightage: CWS: 20-35 PRS: 0 MTE: 20-30 ETE: 40-50 PRE: 0

5. Credits: 4 6. Semester: Both 7. Subject Area: PEC

8. Pre-requisite: Nil

9. Objective: The course will introduce the students to the applications of data analysis and machine learning methods to the materials science problems. The course will provide an introduction to basic informatics and then focus on their application in materials synthesis, structural design and property optimization.

	Contents		
		Hours	
1	Introduction to Materials Informatics: History of materials development and need for new approaches, Multiscale materials	8	
	modelling, need for data driven modelling, accelerated materials		
	discovery and development, Quantitative structure-processing- property- performance relationships, knowledge discovery workflow for materials		
	informatics, materials data science – structured and unstructured data, data mining, crystallography data base, Materials Genome, different sets of descriptors, nuts and bolts of materials informatics.		
2	Optimization - Calibration: gradient based optimization, non- gradient	8	
	based optimization, multi objective genetic algorithms (MOGA),		
	Optimization of a multivariate model, applications to materials synthesis,		
	processing, and transport phenomena.	0	
3	Predictive Modelling: supervised learning, regression methods, classification methods, surrogate based optimization, prediction of material properties such as fatigue life, creep life.	8	
4	Descriptive Modelling: Unsupervised learning, clustering analysis,	8	
7	clustering algorithms. Case studies: Estimation of microstrain, residual stress from diffraction, classification of materials based on physical properties.	0	
5	Limitations and Remedies: Problem of small datasets in materials science, Data dimensionality reduction – principal component analysis, applications to 4D diffraction, spectroscopic data sets, high-throughput computational modelling of materials.	6	
6	Materials Selection for Engineering Design: Systematic selection methods, trade-off analysis, vectors for materials development	4

NAME OF DEPARTMENT/CENTRE: Department of Electronics and Communication Engineering

1. Subject Code: ECN-526 Course Title: Statistical Machine Learning for Variation-

Aware Electronic Device and Circuit Simulation

2. Contact Hours: L: 3 T: 1 P: 0

3. Examination Duration (Hrs.): Theory: 3 Practical: 0

4. Relative Weightage: CWS: 20-35 PRS: 0 MTE: 20-30 ETE: 40-50 PRE: 0

5. Credits: 4 6. Semester: Spring 7. Subject Area: PEC

8. Pre-requisite: Knowledge of basic concepts in probability and statistics

9. Objective: To familiarize students with the fundamental concepts, techniques and algorithms needed to perform stochastic simulation and uncertainty quantification of electronic devices, circuits and systems.

S.No.	Contents	Contact hours
1.	Introduction : Introduction to stochastic modeling of general systems,	2
	key differences between stochastic simulation and classical deterministic	
	simulation. The need for uncertainty quantification in general device, circuit,	
	and system simulation.	
2.	Introduction to Random Variables: Discrete and continuous random	3
	variables: distribution and density functions, conditional distributions and	
	expectations, functions of random variables, statistical moments, sequence of	
	random variables, central limit theorem, Gaussian and non-Gaussian	
	correlation among random variables	
3.	Random Sampling Techniques: Utilization of random sampling techniques	5
	for statistical analysis such as Monte Carlo, quasi-Monte Carlo, Latin	
	hypercube sampling, analysis of computational complexity and convergence	
4	rate of different random sampling techniques	
4.	Statistical Machine Learning - Generalized Polynomial Chaos (PC)	6
	Theory : Basic foundation of polynomial chaos, generalization of polynomial	
	chaos for different known distributions, Wiener-Askey scheme of	
	polynomials, generation of orthonormal basis functions using three-term	
	recurrence series and Gram-Schmidt algorithm, training of polynomial chaos	
	metamodels using quadrature techniques and least-squares linear regression.	
	Deployment of PC theory for calculating statistical moments and density	
	functions in linear and nonlinear VLSI as well as RF/microwave devices,	
	circuits, and systems via test cases and illustrative examples.	
5.	Correlations in PC Theory: Considering uncorrelated, Gaussian correlated,	5
	and non-Gaussian (mixed Gaussian model) correlated parametric variations.	
6.	Advanced PC theory: Complexity analysis of PC theory and techniques:	13
	limitations of curse of dimensionality in PC theory, emphasis on	
	sensitivity analysis-based dimension reduction, active subspaces,	
	sliced inverse regression compressed sensing, partial least-squares	
	algorithm, and multi-fidelity methods.	

7.	Inverse Problems: Bayes rule, Bayesian formulation of inverse	8
	problems, prior and posterior distributions, calculation of maximum	
	likelihood function using PC theory. Applications into inverse	
	uncertainty quantification in linear/nonlinear devices, circuits and systems

2. Contact Hours: L: 3 T: 1 P: 0

3. Examination Duration (Hrs): Theory: 3 **Practical:** 0

4. Relative Weightage: CWS: 20-35 PRS: 0 MTE: 20-30 ETE: 40-50 PRE: 0

5. Credits: 4 6. Semester: Both 7. Subject Area: PEC

8. Pre-requisite: Good foundation in Mathematics and Physics with specific exposure in Numerical Methods. Understanding of fundamental principles of Geology and Geophysics would be preferable.

9. Objective: To make the participants familiar with tools and techniques in Earth Sciences and the use of Machine Learning and Artificial Intelligence for optimizing the workflows for more accurate prediction of events and properties of the subsurface.

S.No.	Contents	Contact Hours
1	Familiarization with Major Domains and Data Types in Earth Sciences: Earthquake Seismology, Engineering Geology and Rock Mechanics, Reservoir	4
	Characterization, Paleontology	
2	General Introduction to ML and AI in Earth Sciences: ML and statistical pattern recognition: Supervised learning (generative/ descriptive learning, parametric/ non-parametric learning, neural networks, Support vector machines), Unsupervised learning (clustering, dimensionality reduction, kernel methods); time series modelling, linear regression, regularization, linear classifiers, ensemble methods, neural networks, model selection and evaluation, scalable algorithms for big data, and data ethics. Data science: Extreme value statistics, multi-variate analysis, factor analysis, compositional data analysis, spatial information aggregation models, spatial estimation,	
	geo-statistical simulation, treating data of different scales of observation, spatio-temporal modelling (geo-statistics).	
3	Automating Data Mining and Analysis in Seismology: Basics of earthquake detection and phase picking using short-term average (STA)/long-term average (LTA); detection using waveform similarity: Network Matched Filtering/template matching, Fingerprint And Similarity Thresholding (FAST). Associating seismic phases across all stations using deep-learning techniques and combining the ones have the same origin source (PhaseLink). Generic workflow of data collection, preprocessing, model training, model evaluation, and production. Applications of ML in ground motion synthesis, and future directions.	
4	Classification of Earthquake Sources: Using supervised learning for classifying earthquakes and finding their occurrence mechanism. Training dataset (waveforms) on different kinds of sources: earthquake, glacial, volcanic, landslide, explosion, etc. A brief discussion on seismic sources and radiation pattern of emerging waves.	4
5	Deep learning (DL) based Seismic Inversion: Theory of Seismic Inversion, Convolutional neural network (CNN) and fully connected network (FCN) architectures, Performance evaluation, Geophysical inversion versus ML, their applications to reflectivity inversion in seismic, Numerical examples.	4

3.	Real Arithmetic: Representing the real numbers, floating-point arithmetic, The	8
	ANSI/IEEE floating point standard, Floating-point arithmetic operations,	
	Rounding schemes, Logarithmic number systems, Floating-point adders, Barrel-	
	shifter design, Leading-zeros/ones counting, Floating-point multipliers, Floating-	
4	point dividers, Arithmetic Errors and error control.	
4.	Implementation Topics: Computing algorithms, Exponentiation, Approximating functions, Merged arithmetic, Arithmetic by table lookup, Tradeoffs in cost, speed,	6
	and accuracy. High-throughput arithmetic, Low-power arithmetic, Fault-tolerant	
	arithmetic, Impact of hardware technology.	
5.	VLSI architectures: Analog VLSI neural learning circuits, An analog CMOS	8
	implementation of Kohonen network with learning capability, Backpropagation	
	learning algorithms for analog VLSI implementation, Analog implementation of	
	the Boltzmann machine with programmable learning algorithms, VLSI design of	
	the minimum entropy neuron.	
6.	VLSI Designs: VLSI design of a 3-D highly parallel message-passing architecture,	8
	A dataflow architecture for AI, Processing in-memory design, COLIBRI:	
	Coprocessor for LISP based on RISC.	42

NAME OF DEPARTMENT/CENTRE: Mehta Family School of Data Science and Artificial Intelligence

1. Subject Code: AID-583 Course Title: Data-driven Analytics for Smart Transportation Systems

2. Contact Hours: L: 3 T: 1 P: 0

3. Examination Duration (Hrs.): Theory: 3 Practical: 0

4. Relative Weightage: CWS: 20-35 PRS: 0 MTE: 20-30 ETE: 40-50 PRE: 0

5. Credits: 4 6. Semester: Both 7. Subject Area: PEC

8. Pre-requisite: Nil

9. Objective: To familiarize with the applications of data science in traffic and transportation engineering and to demonstrate the applications of the data science in smart transportation planning

S.No.	Contents	Contact
1		hours
1.	Data Science in Transportation	4
	Overview and Practical Applications; Transportation Data Sources; Data	
2	Collection; Data Preparation and Visualization.	0
2.	Sensing and Data Mining for Smart Transportation Systems	8
	Intelligent Transportation Systems, Incident Management Program, Efficient	
	Emergency Vehicle Movement (Pre-Emption), Crash Detection, Reporting, and	
	Clearance; Traffic Surveillance, Identification of Hotspots, Violation Detection;	
	Road Network Asset Management, Inventory of Potholes, other Deficiencies;	
2	Adaptive Traffic Signal.	1.0
3.	Data Analytics in Urban Transportation Planning	10
	Basics of Urban Transportation Planning, Data Collection and Advanced Data	
	Sources, Household Surveys, Demand Modeling using WiFi/ Bluetooth/ Call Data	
	Record, Data Extraction and Analysis using APIs, Trip Distribution Modelling	
	Approaches, Route Choice Models, Choice Set Generation Methods, Genetic	
	Algorithms, Transportation Planning Example using Data-Driven Modeling and	
4	Simulation.	-
4.	Urban Mass Transit System Paring of Librar Mass Transit System Static and Dynamic CTES Paul Time	6
	Basics of Urban Mass Transit System, Static and Dynamic GTFS, Real-Time	
	Transit, Travel Time Variability, Transit Reliability, Transit Planning using Smart-	
	Card Data, Real-Time Accessibility Analysis.	
5.	Applications in Environmental Impact of Transport System	6
	IOT based Air pollution, Real-Time Air Pollution Monitoring and Data Analysis,	
	Placement of Mobile Sensors, Pollution Prediction using ML, Noise Data, Analysis	
	of Key Parameters, Development of Policy Framework.	
6.	Crash Data Analytics	8
	Crash Data, Data Preparation, Model Estimation, Real-Time Data-Driven	
	Analysis; Emergency Vehicle Data, Crash Prone Stretches, Ambulance	
	Deployment; Near-misses/Traffic Conflict Data, Surrogate Approach, Proactive	
	Assessment and Safety Interventions.
